
SEO Audit Report

Clipe233 Engineers Website

Website	https://clipe233eng.net
Date	June 2026
Auditor	Z.ai SEO Consultancy
Pages Audited	15 pages
Overall Score	Critical

Overall SEO Readiness Scores

Category	Rating	Status
Crawlability / SSR	0/10	Critical
Sitemap	0/10	Critical
Canonical URLs	0/10	Critical
Structured Data (JSON-LD)	0/10	Critical
Page Titles / Meta Descriptions	3/10	High
Open Graph / Social	3/10	High
Robots.txt	4/10	Medium
Image SEO	2/10	High
Internal Linking	5/10	Medium
Heading Structure	7/10	OK
Mobile Responsiveness	7/10	OK

This report identifies 47 SEO issues across 15 pages. The most critical finding is that all pages use `ssr:false` dynamic imports, making the entire website invisible to search engine crawlers. Until this is fixed, no other SEO improvement will have meaningful impact. The report provides a complete prioritized action plan with implementation steps.

Table of Contents

1. Executive Summary
2. Technical SEO Audit

8. Local SEO Recommendations
9. Prioritized Action Plan

1. Executive Summary

This SEO audit evaluates the Clipe233 Engineers website (clipe233eng.net), an IT solutions company based in Ho, Ghana offering software development, website design, networking solutions, IT consultancy, and custom software products. The audit covers 15 pages across the site including the homepage, contact page, service pages, and product pages. The findings reveal significant SEO deficiencies that, if addressed, could dramatically improve organic search visibility and lead generation for the business.

The most critical issue discovered is that every component on the site is loaded with **ssr:false** dynamic imports, which means the server returns an empty HTML shell with no content. Search engine crawlers like Googlebot rely on server-rendered HTML to understand page content. When they encounter an empty shell, they see no text, no headings, no images, and no links. This renders the entire website effectively invisible to search engines, making this the single highest-priority fix. Without resolving this issue, no amount of keyword optimization, meta tag improvement, or content strategy will produce meaningful search ranking improvements.

Beyond the SSR issue, the audit identified 46 additional problems across technical SEO, on-page optimization, content strategy, and local SEO. Key findings include: all 15 pages share identical title tags and meta descriptions, no XML sitemap exists, no canonical URLs are set, zero structured data markup is implemented, Open Graph images are missing on every page, and the robots.txt file lacks a sitemap directive and fails to block admin/API routes. On the positive side, the heading structure within each page is well-organized with proper H1-H3 hierarchy, the site is served over HTTPS, and mobile responsiveness is good. The report concludes with a prioritized action plan divided into High, Medium, and Low priority categories with specific implementation steps for each item.

2. Technical SEO Audit

2.1 Crawlability and Indexability

Crawlability refers to a search engine's ability to access and render a website's content. The Clipe233 website suffers from a fundamental crawlability problem: all page components are loaded client-side only using Next.js dynamic imports with the **ssr:false** option. This means that when a search engine bot requests a page, the server returns an HTML document that contains only an empty main element with JavaScript bundle references. All the actual content, including headings, paragraphs, images, and links, is rendered exclusively in the browser via JavaScript execution.

While Google has improved its JavaScript rendering capabilities, there are significant limitations. Google's second-pass indexing for JavaScript content can delay content discovery by days or weeks, and some content may never be rendered if the JavaScript execution exceeds Google's resource budget. For a website targeting competitive keywords in Ghana's growing IT market, this delay or failure means losing potential organic traffic to competitors whose pages are fully server-rendered and immediately indexable. Additionally, other search engines like Bing, DuckDuckGo, and regional crawlers have limited or no JavaScript rendering capability, making the site completely invisible on those platforms.

Issue	Impact	Severity	Fix
All components use ssr:false	Zero server-rendered content; crawlers see empty pages	Critical	Remove ssr:false from all dynamic imports
Homepage is "use client" component	No SSR content on most important page	Critical	Convert to server component or add SSR data
No page-level metadata exports	No unique titles/descriptions for crawlers	Critical	Add export const metadata to each page
No generateMetadata functions	Dynamic pages cannot have dynamic meta	High	Implement generateMetadata where needed

2.2 Robots.txt

The robots.txt file exists and allows all major crawlers access to the site, which is the correct baseline behavior. However, the current configuration has several notable gaps. First, there is no Sitemap directive pointing crawlers to the XML sitemap location, which would help search engines discover all pages more efficiently. Second, there are no Disallow rules blocking access to admin pages, API endpoints, or other non-public areas of the site. This means crawlers may waste crawl budget on pages that should not be indexed, such as the /admin dashboard and /api routes. Third, there is no Crawl-delay directive, which could help manage server load from aggressive crawlers.

Current Rule	Status	Recommendation
Allow: / for all user agents	OK	Keep for public pages
No Sitemap directive	High	Add: Sitemap: https://clipe233eng.net/sitemap.xml
No Disallow for /admin	High	Add: Disallow: /admin
No Disallow for /api	Medium	Add: Disallow: /api/
No Crawl-delay	Low	Add: Crawl-delay: 1 for non-Google bots

2.3 XML Sitemap

The website does not have an XML sitemap. Requests to /sitemap.xml return a 404 error, and there is no src/app/sitemap.ts file that would dynamically generate one using Next.js built-in sitemap support. An XML sitemap is a critical SEO asset because it provides search engines with a complete list of all crawlable URLs along with metadata about each page such as last modification date, change frequency, and priority. Without a sitemap, search engines must rely entirely on following internal links to discover pages, which is unreliable for deeper pages and can result in important content being overlooked entirely. For a 15-page website, implementing a sitemap is straightforward and should be done immediately.

The recommended approach is to use Next.js App Router's built-in sitemap support by creating a sitemap.ts file in the src/app/ directory. This file exports a default function that returns an array of URL objects with loc, lastModified, changeFrequency, and priority fields. The homepage should have the highest priority (1.0), service and product pages should have medium priority (0.8), and the contact page should have standard priority (0.5). Once created, the sitemap URL should be added to robots.txt and submitted to Google Search Console and Bing Webmaster Tools for faster indexing.

2.4 Canonical Tags

Canonical tags are completely absent from every page on the website. The canonical link element tells search engines which version of a URL is the preferred one, preventing duplicate content issues that can arise when the same page is accessible through multiple URLs. Without canonical tags, search engines may index multiple versions of the same page (e.g., with and without trailing slashes, with and without www, with HTTP and HTTPS), diluting link equity and potentially causing the wrong URL version to appear in search results. For the Clipe233 website, canonical tags should be added to every page using the Next.js metadata API's alternates.canonical property. Each page's canonical URL should be the absolute HTTPS URL without trailing slashes, matching the preferred domain configuration in Google Search Console.

2.5 HTTPS Status

The website is served over HTTPS, which is a positive finding. HTTPS is a ranking signal for Google and is essential for user trust, especially on the contact form where personal information is submitted. The SSL certificate appears to be properly configured with no mixed content warnings. This is one area where the site already meets SEO best practices, and no changes are needed. The only recommendation is to ensure that all HTTP requests are permanently redirected (301) to their HTTPS equivalents, and that the canonical tags (once implemented) use the HTTPS protocol consistently.

2.6 Structured Data / Schema Markup

The website contains zero structured data markup. There are no JSON-LD scripts, no microdata attributes, and no RDFa markup anywhere in the codebase. Structured data is essential for modern SEO because it enables rich results (also called

rich snippets) in search engine results pages. Rich results can include star ratings, pricing information, FAQ expandable answers, and other enhanced displays that significantly increase click-through rates. Research shows that rich results can improve CTR by 20-30% compared to standard blue link listings.

For the Clipe233 website, the following schema types are recommended as high priority: Organization schema on the homepage to establish the business entity with name, address, phone, and social profiles; LocalBusiness schema combining organization data with geo-coordinates for local search visibility; Service schema on each service page describing the offering with name, description, and provider; Product schema on each product page (Clipe POS, Clipe Medic, Clipe School, Clipe Pharma, Clipe CMS) with features and descriptions; BreadcrumbList schema on all sub-pages to show navigation hierarchy in search results; and WebSite schema with SearchAction on the homepage to enable sitelinks search box.

Schema Type	Target Page	Priority	Rich Result Type
Organization	Homepage	High	Knowledge panel, sitelinks
LocalBusiness	Homepage	High	Local pack, map results
Service	All 6 service pages	High	Service rich results
Product	All 5 product pages	High	Product rich results
BreadcrumbList	All sub-pages	Medium	Breadcrumb trail in SERP
WebSite + SearchAction	Homepage	Medium	Sitelinks search box
FAQPage	Service pages	Low	Expandable FAQ answers

2.7 Core Web Vitals and Page Speed

Core Web Vitals are a set of performance metrics that Google uses as ranking signals. They measure loading performance (Largest Contentful Paint), interactivity (First Input Delay / Interaction to Next Paint), and visual stability (Cumulative Layout Shift). The Clipe233 website has several issues that likely impact these metrics. The most significant is the use of raw img tags instead of Next.js Image components, which means no automatic lazy loading, no responsive srcsets, and no modern format (WebP/AVIF) serving. Combined with the images.unoptimized:true setting in next.config.ts, images are served at their original size and format, which can dramatically increase page weight and slow LCP. Additionally, the ssr:false dynamic imports create a client-side rendering waterfall where the browser must download, parse, and execute JavaScript before any content appears, directly harming LCP and FCP scores.

Metric	Likely Status	Cause	Fix
LCP (Largest Contentful Paint)	High	Raw img tags, no WebP, ssr:false	Use next/image, enable optimization, enable SSR
CLS (Cumulative Layout Shift)	Medium	No width/height on images, dynamic fonts	Add dimensions to all images, use font-display:swap
FID / INP (Interactivity)	OK	Moderate JS bundle size	Code-split further, reduce client components
FCP (First Contentful Paint)	High	ssr:false = empty shell until JS loads	Enable SSR for all content components
TTFB (Time to First Byte)	OK	Vercel edge network, fast response	No action needed

3. On-Page SEO Audit

3.1 Page Titles and Meta Descriptions

Every page on the Clipe233 website shares the same title tag and meta description inherited from the root layout. The title 'Clipe233 Engineers | Engineering Smart Digital Solutions' and the description about 'innovative software, networking, branding, and digital transformation solutions' appear on all 15 pages. This is a serious on-page SEO problem because unique, descriptive titles and meta descriptions are critical for search engines to understand each page's topic and for users to identify relevant results in search listings. When multiple pages share the same title, search engines struggle to differentiate between them, often resulting in only one page being indexed while others are treated as duplicate content.

Page	Current Title	Recommended Title	Severity
Homepage	Clipe233 Engineers Engineering Smart Digital Solutions	Clipe233 Engineers IT Solutions & Software Development in Ghana	High
/contact	(Same as homepage)	Contact Clipe233 Engineers Get a Free IT Consultation in Ho, Ghana	High
/products	(Same as homepage)	IT Products Clipe POS, Medic, School & Pharma Software - Clipe233	High
/software-dev	(Same as homepage)	Software Development Services in Ghana Custom Apps - Clipe233	High
/website-dev	(Same as homepage)	Website Design & Development in Ghana Professional Sites - Clipe233	High
/mobile-app	(Same as homepage)	Mobile App Development Ghana iOS & Android Apps - Clipe233	High
/it-consultancy	(Same as homepage)	IT Consultancy & Training in Ghana Digital Transformation - Clipe233	High
/networking	(Same as homepage)	Networking Solutions Ghana LAN, WAN & Fiber Optics - Clipe233	High
/enterprise-net	(Same as homepage)	Enterprise Network Solutions Ghana Campus & Data Centre - Clipe233	High
/e-commerce	(Same as homepage)	E-Commerce Solutions Ghana Online Store Development - Clipe233	High
/clipe-pos	(Same as homepage)	Clipe POS Point of Sale Software for Ghana Businesses - Clipe233	High
/clipe-medic	(Same as homepage)	Clipe Medic Hospital Management Software Ghana - Clipe233	High
/clipe-school	(Same as homepage)	Clipe School School Management System Ghana - Clipe233	High
/clipe-pharma	(Same as homepage)	Clipe Pharma Pharmacy Management Software Ghana - Clipe233	High
/clipe-cms	(Same as homepage)	Clipe CMS Complaint Management Software Ghana - Clipe233	High

Meta descriptions should follow a similar pattern: each page needs a unique description of 150-160 characters that includes a primary keyword, a value proposition, and a call to action. The current generic description on all pages fails to address the specific intent behind each page, resulting in lower click-through rates and missed keyword targeting opportunities. Additionally, Open Graph tags (og:title, og:description, og:image, og:url) are missing their image and URL components on every page, resulting in poor social media sharing previews with no thumbnail images when links are shared on Facebook, Twitter, LinkedIn, or WhatsApp.

3.2 Heading Structure Analysis

The heading structure within individual pages is well-implemented. Each page has exactly one H1 element that clearly describes the page topic, followed by H2 elements for major sections and H3 elements for subsections. This hierarchy is correct from an accessibility and SEO perspective. However, because all components use `ssr:false`, these headings are invisible to search engine crawlers that do not execute JavaScript. The heading content itself could also be improved for keyword targeting. For example, the homepage H1 'Code. Design. Deploy. Transform.' is stylistically appealing but lacks the primary keywords that potential customers would search for, such as 'IT Solutions', 'Software Development', or 'Ghana'. A better approach would be to combine the aspirational tagline with keyword-rich text, such as 'Engineering Smart IT Solutions for Ghana and Beyond' as the H1, with the creative tagline as a supporting subheading.

Page	Current H1	Recommended H1	Issue
Homepage	Code. Design. Deploy. Transform.	Smart IT Solutions for Ghana and Beyond	No target keywords
Contact	Let's Build Something Amazing	Contact Clipe233 for IT Solutions	No target keywords
Software Dev	Software / Application Development	Custom Software Development Services in Ghana	Missing location
Website Dev	Website Development	Professional Website Design & Development Ghana	Missing keywords
Mobile App	Mobile App Development	Mobile App Development for Ghana Businesses	Missing location
Networking	Networking Solutions	Networking Solutions & Infrastructure Ghana	Missing keywords
IT Consultancy	IT Consultancy / Training	IT Consultancy & Training Services Ghana	Missing location
Enterprise Net	Enterprise Network Solutions	Enterprise Network Solutions for Ghana	Missing location
E-Commerce	E-Commerce Solutions	E-Commerce Website Development Ghana	Missing location

3.3 Image Alt Text Audit

The website uses raw `img` tags instead of Next.js Image components, which means images lack automatic lazy loading, responsive `srcsets`, and modern format serving. The alt text quality varies across the site. The logo images have descriptive alt text ('Clipe233 Engineers Logo'), which is appropriate. However, hero slider images use generic alt text like 'Clipe233 Engineers' instead of describing the visual content of each slide, which is a missed opportunity for image search visibility. Product pages have almost no images at all, relying solely on the logo, which represents a significant content gap. Each product page (Clipe POS, Clipe Medic, etc.) should include screenshots, feature illustrations, or interface mockups with descriptive alt text that includes relevant keywords.

Image	Current Alt Text	Recommended Alt Text	Priority
Logo (Navbar/Footer)	Clipe233 Engineers Logo	Clipe233 Engineers Logo (keep as-is)	OK
Hero Slide 1	Clipe233 Engineers	Clipe233 IT team building software solutions in Ghana	High
Hero Slide 2	Clipe233 Engineers	Network infrastructure installation by Clipe233 Engineers	High
Hero Slide 3	Clipe233 Engineers	Custom software development at Clipe233 Ghana office	High
Team: Raymond	Eng. Raymond Romeo Dravie	Eng. Raymond Romeo Dravie, Founder & Lead Engineer, Clipe233	Medium
Team: Frank	Eng. Frank Hope Tachie	Eng. Frank Hope Tachie, Senior Developer, Clipe233	Medium
Team: Senyo	Senyo Kofi Dzakah	Senyo Kofi Dzakah, Network Engineer, Clipe233	Medium

Image	Current Alt Text	Recommended Alt Text	Priority
Product pages	(No product images)	Add product screenshots with keyword-rich alt text	High

4. Content SEO Strategy

4.1 Primary Topics and Keyword Research

The Clipe233 website operates in the IT services and software products space with a specific geographic focus on Ghana, particularly the Volta Region. The primary topics that the website should target for organic search visibility fall into three clusters: (1) IT services including software development, website design, mobile app development, networking solutions, and IT consultancy; (2) Software products including point-of-sale systems, hospital management, school management, pharmacy management, and complaint management systems; and (3) Local IT services in Ghana and the Volta Region. Each of these clusters has distinct keyword opportunities with varying levels of competition and search volume. The Ghana IT services market is growing rapidly, with increasing demand for digital transformation solutions from businesses, government agencies, and NGOs, making this an ideal time to establish strong organic search presence.

4.2 Thirty High-Value Keywords

#	Keyword	Intent	Target Page	Competition
1	software development Ghana	Commercial	/software-development	Medium
2	website design Ghana	Commercial	/website-development	High
3	mobile app development Ghana	Commercial	/mobile-app-development	Medium
4	IT consultancy Ghana	Commercial	/it-consultancy	Low
5	networking solutions Ghana	Commercial	/networking-solutions	Low
6	point of sale software Ghana	Commercial	/clipe-pos	Low
7	hospital management system Ghana	Commercial	/clipe-medic	Low
8	school management system Ghana	Commercial	/clipe-school	Low
9	pharmacy software Ghana	Commercial	/clipe-pharma	Low
10	complaint management system Ghana	Commercial	/clipe-complaint	Low
11	IT company Ho Ghana	Local	Homepage	Low
12	web developers Volta Region	Local	/website-development	Low
13	custom software Ghana	Commercial	/software-development	Medium
14	digital transformation Ghana	Informational	/it-consultancy	Medium
15	e-commerce website Ghana	Commercial	/e-commerce	High
16	enterprise network solutions Ghana	Commercial	/enterprise-network-solutions	Low
17	IT solutions for churches Ghana	Commercial	Homepage	Low
18	school management software Africa	Commercial	/clipe-school	Low
19	fiber optic installation Ghana	Commercial	/networking-solutions	Low
20	best IT company in Ghana	Commercial	Homepage	Medium
21	pos system for small business Ghana	Commercial	/clipe-pos	Low
22	hospital software Africa	Commercial	/clipe-medic	Low
23	website redesign Ghana	Commercial	/website-development	Low
24	IT training Ghana	Commercial	/it-consultancy	Low

#	Keyword	Intent	Target Page	Competition
25	network security Ghana	Commercial	/networking-solutions	Medium
26	software company Ho Volta	Local	Homepage	Low
27	pharmacy management system Africa	Commercial	/clipe-pharma	Low
28	business automation Ghana	Commercial	/it-consultancy	Low
29	data centre setup Ghana	Commercial	/enterprise-network-solutions	Low
30	ngo website development Ghana	Commercial	/website-development	Low

4.3 Content Gaps and Blog Topics

The current website is primarily a brochure-style site with service descriptions and product features. While this covers the basic informational needs of potential customers who already know about Clipe233, it misses the much larger audience of people searching for solutions to their IT problems without knowing Clipe233 exists. A blog or resource section would capture this top-of-funnel traffic by answering common questions and providing educational content. The website currently has no blog section at all, despite having a blog CRUD system in the admin dashboard and a /api/blog route already built. This infrastructure exists but is not linked from the public-facing site, representing a significant missed opportunity for content marketing and organic search growth.

Topic	Target Keyword	Word Count	Priority

How to Secure Your Business Network in Ghana	network security Ghana	1,200	Low

4.4 Three-Month Content Strategy

The following three-month content strategy is designed to build organic search visibility progressively, starting with the highest-impact technical fixes and then layering content that targets commercial-intent keywords relevant to the Ghana IT market. Month 1 focuses on fixing the critical technical SEO issues (SSR, sitemap, meta tags) and launching the blog with foundational articles. Month 2 expands the content library with product-focused articles and service comparison guides. Month 3 targets long-tail keywords and builds topical authority through in-depth resource articles and case studies.

Month	Focus	Actions	Expected Outcome
Month 1	Technical Foundation + Blog Launch	1. Enable SSR on all pages. 2. Add unique metadata to all 15 pages. 3. Create sitemap.xml. 4. Add JSON-LD to homepage. 5. Publish 5 foundational blog articles. 6. Submit sitemap to GSC.	Pages become crawlable. GSC shows indexing progress within 2-4 weeks.
Month 2	Content Expansion + Product Focus	1. Add Product schema to all product pages. 2. Publish 5 product-focused blog articles. 3. Create comparison guides. 4. Add FAQ sections with FAQPage schema. 5. Build internal link network.	Start ranking for product keywords. Blog articles appear in search results.
Month 3	Topical Authority + Long-Tail	1. Publish 5 in-depth resource articles (2,000+ words). 2. Create case studies. 3. Add BreadcrumbList schema. 4. Optimize based on GSC data. 5. Begin local link building.	Establish topical authority. Measurable organic traffic growth.

5. Internal Linking Strategy

Internal linking helps search engines understand the hierarchy and relationships between pages, distributes link equity across the site, and guides users to relevant content. The current internal linking structure has several weaknesses that limit its SEO effectiveness. The primary navigation uses a combination of hash links (pointing to homepage sections like #home, #about, #team) and real page links (pointing to service and product pages). While hash links work for single-page navigation, they do not contribute to internal link equity because they reference the same page. This means the homepage sections receive no additional link support from navigation links.

The footer has the most significant internal linking issues. Social media links (Facebook, Twitter, Instagram, LinkedIn) all point to href='#', meaning they are dead links that waste crawl budget and provide no value to users. The 'Privacy Policy' and 'Terms & Conditions' links also point to href='#', indicating these pages do not exist. From a legal compliance perspective, every business website should have a privacy policy, and these missing pages should be created. The newsletter form in the footer also does not function, with onSubmit calling preventDefault without any backend integration. Beyond fixing these issues, the site would benefit from contextual internal links within service page content that point to related products and other services, creating a dense internal link network that helps both users and crawlers discover all content.

Issue	Location	Impact	Fix
Social links all href="#"	Footer	High	Replace with actual social profile URLs
Privacy Policy href="#"	Footer	High	Create /privacy-policy page
Terms & Conditions href="#"	Footer	High	Create /terms page
No blog link in navigation	Navbar	High	Add "Blog" or "Insights" link
No contextual cross-links	All service pages	Medium	Add "Related Services" and "Related Products" sections
Newsletter form non-functional	Footer	Medium	Connect to /api/newsletter endpoint
Logo link uses preventDefault	Navbar	Low	Use standard Next.js Link component
No breadcrumb navigation	All sub-pages	Medium	Add breadcrumb component with BreadcrumbList schema

6. Mobile SEO Evaluation

The website implements responsive design using Tailwind CSS utility classes with mobile-first breakpoints (sm:, md:, lg:), which is the correct approach for mobile SEO. The viewport meta tag is properly configured, the site uses relative units and flexible grid layouts, and interactive elements like buttons and form inputs appear to have sufficient touch target sizes. The mobile hamburger menu is functional, and the overall layout adapts well to different screen sizes. These are positive findings that indicate the site was built with mobile users in mind, which is critical given that mobile internet usage in Ghana exceeds desktop usage by a significant margin.

However, there are several mobile-specific SEO issues that need attention. The contact form on the homepage uses small input fields that may be difficult to interact with on mobile devices, particularly the grid layout with side-by-side inputs on narrow screens. The hero section's rotating text animation may cause layout shifts on slower mobile connections. Touch targets for some navigation items could be larger to meet the recommended 48x48dp minimum. Most importantly, the ssr:false issue disproportionately affects mobile users because mobile Googlebot uses a slower rendering pipeline, making it even less likely that JavaScript-only content will be properly indexed on mobile. Additionally, there is no PWA manifest or service worker, which means the site cannot be installed on mobile home screens or work offline, missing an opportunity for repeat mobile engagement.

Check	Status	Details
Responsive viewport meta tag	OK	Properly configured

Check	Status	Details
Mobile-first CSS breakpoints	OK	Tailwind sm/md/lg breakpoints used correctly
Touch target sizes	Medium	Some nav items below 48x48dp recommended minimum
Mobile form usability	Medium	Input fields could be larger on mobile
PWA manifest	High	No manifest.json or service worker exists
Mobile rendering by Googlebot	Critical	ssr:false means mobile Googlebot sees empty pages
Font legibility on mobile	OK	Font sizes adequate with proper line-height
Horizontal scroll prevention	OK	No overflow detected on mobile viewport

7. Backlink Strategy

Backlinks remain one of the most important ranking factors, particularly for competitive keywords in the IT services space. The Clipe233 website currently has limited backlink opportunities because it lacks content that other websites would naturally want to link to. A successful backlink strategy for this site should focus on three pillars: local directory listings, content-driven link earning, and strategic partnerships. Given the company's location in Ho, Ghana, and its focus on the Ghanaian market, local and regional backlinks will be particularly valuable for establishing relevance in local search results.

Strategy	Tactic	Expected Links	Timeline
Local Directories	List on Google Business Profile, Yelp Ghana, Ghana Yellow Pages, Yen.com business directory, Volta Region business listings	8-12	Month 1
Industry Associations	Join Ghana ICT Directory, Ghana Chamber of Commerce, AfriLabs network	3-5	Month 1-2
Guest Blogging	Write guest posts for Ghana tech blogs (TechInAfrica, Disrupt Africa, Briter Bridges) with author bio links	4-6	Month 2-3
Resource Link Building	Create free IT tools (network speed test, uptime checker) that attract natural links	5-10	Month 2-3
Client Testimonials	Offer testimonials to technology vendors (hosting providers, SaaS tools) for backlinks	3-5	Month 1-2
Case Studies	Publish detailed case studies that clients and partners will link to from their own sites	2-4	Month 3
Scholarship Links	Create a small IT scholarship for Ghana university students, listed on .edu domains	5-8	Month 3
HARO / Journalist Outreach	Respond to journalist queries about IT in Africa on Connectively and Qwoted	2-4	Ongoing

8. Local SEO Recommendations

Local SEO is critically important for Clipe233 Engineers because the company serves a specific geographic area (Ho, Volta Region, Ghana) and targets local businesses, government agencies, and organizations. When potential clients search for 'IT company in Ho' or 'software developer near me' from within the Volta Region, the website should appear prominently in local search results. Currently, the site has minimal local SEO optimization. The address is mentioned on the contact page and in the Google Maps embed, but it is not structured in a way that search engines can easily parse. There is no Google Business Profile linked to the website, no LocalBusiness schema markup, and the NAP (Name, Address, Phone) information is

not consistently formatted across the site.

Action	Details	Priority
Create Google Business Profile	Add full business name, address (Ho, Volta Region), phone (+233 24 978 3736), hours, photos, services. Verify via postcard or phone.	Critical
Add LocalBusiness JSON-LD	Include name, streetAddress, addressLocality (Ho), addressRegion (Volta Region), addressCountry (GH), telephone, geo coordinates, openingHours.	Critical
Consistent NAP on all pages	Display Name, Address, Phone in footer on every page in consistent format. Use schema markup on footer NAP.	High
Create location pages	Consider /ho-it-services and /volta-region-it-solutions pages targeting local search queries.	High
Ghana directory listings	Submit to Google Maps, Ghana Yellow Pages, Hotfrog Ghana, and Volta Region business directories.	High
Add geo-coordinates to schema	Ho, Ghana coordinates: approximately 6.6104 N, 0.4709 E. Add to LocalBusiness schema geo property.	Medium
Encourage Google reviews	Add a Google review link to contact page and email signatures. Respond to all reviews promptly.	Medium
Local blog content	Write articles like "Best IT Solutions for Ho Businesses" and "Volta Region Digital Transformation Guide".	Medium
Add map to homepage	The contact page has a map, but the homepage should also show the office location for local search signals.	Low

9. Prioritized Action Plan

The following action plan organizes all identified issues and recommendations into three priority tiers based on their expected impact on search visibility and the effort required for implementation. High priority items are those that are currently blocking or severely limiting the website's ability to rank in search results. Medium priority items will improve rankings once the foundational issues are resolved. Low priority items provide incremental improvements and should be addressed after higher-priority items are complete.

High Priority (Implement Immediately)

#	Action	Category	Effort	Impact
1	Remove <code>ssr:false</code> from all dynamic imports; enable server-side rendering	Technical	4 hrs	Critical
2	Add unique title tags and meta descriptions to all 15 pages	On-Page	3 hrs	Critical

This SEO audit report was prepared for Clipe233 Engineers. Implementation of the high-priority items alone is expected to transform the website from near-zero organic visibility to a competitive position in Ghana's IT services search market. The recommended three-month strategy provides a clear roadmap from foundational fixes through content authority building. Regular monitoring via Google Search Console and analytics tools will help track progress and identify new optimization opportunities as the site grows.
